**Part A: Short Answer Questions**

1. Define the term 'Ecosystem' and give an example of a natural ecosystem.

2. Explain the difference between a community and an ecosystem.

**Part B: Long Answer Questions**

Q. No.	Question	Answer
1.	Explain the flow of energy in an ecosystem.	Energy flows from the sun to producers (plants) through photosynthesis. It then moves to consumers (herbivores) and finally to decomposers (fungi and bacteria) which break down the dead organic matter and release nutrients back into the soil.
2.	Describe the structure of a food chain.	A food chain is a linear sequence of organisms through which nutrients and energy pass as they are eaten by organisms. It starts with a producer (autotroph) at the base, followed by primary consumers (herbivores), secondary consumers (carnivores), and tertiary consumers (top predators).
3.	What is a food web? Give an example.	A food web is a network of food chains that are interconnected at various trophic levels. For example, in a grassland ecosystem, grass is eaten by rabbits and deer. Rabbits and deer are eaten by foxes. Foxes are eaten by eagles. This shows multiple energy pathways.
4.	Explain the role of decomposers in an ecosystem.	Decomposers play a crucial role in recycling nutrients. They break down dead organic matter from plants and animals into simple inorganic substances that can be reused by producers. Without decomposers, the ecosystem would be overwhelmed by dead matter and nutrients would be locked up.
